## Machine Learning 2

Due: April 12, 2016

# Homework 2

Instructor: Ke Tran Email: m.k.tran@uva.nl

Student: Andrea Jemmett UvA ID: 11162929 Collaborators: N/A Email: andreajemmett@gmail.com

You are allowed to discuss with your colleagues but you should write the answers in your own words. If you discuss with others, write down the name of your collaborators on top of the first page. No points will be deducted for collaborations. If we find similarities in solutions beyond the listed collaborations we will consider it as cheating. We will not accept any late submissions under any circumstances. The solutions to the previous homework will be handed out in the class at the beginning of the next homework session. After this point, late submissions will be automatically graded zero.

\* denotes bonus exercise. You earn 1 point for solving each bonus exercise. All bonus points earned will be added to your total homework points.

**Problem 1.** Consider three variables  $a, b, c \in \{0,1\}$  having the joint distribution p(a,b,c) given in Table 1. By direct evaluation, show that

- 1.  $p(a,b) \neq p(a)p(b)$ ;
- 2. p(a, b|c) = p(a|c)p(b|c);
- 3. p(a,b,c) = p(a)p(c|a)p(b|c), and draw the corresponding directed graph.

Table 1: The joint distribution over three binary variables.

a	b	c	p(a,b,c)
0	0	0	0.192
0	0	1	0.144
0	1	0	0.048
0	1	1	0.216
1	0	0	0.192
1	0	1	0.064
1	1	0	0.048
1	1	1	0.096

**Problem 2.** Consider all the Bayesian networks consisting of three vertices X, Y and Z. Group them into clusters such that all the graphs in each cluster encode the same set of independence relations. Draw those clusters and write down the set of independence relations for each cluster.

#### Problem 3.

Homework 2

1. Given distributions p and q of a continuous random variable, Kullback-Leibler divergence of q from p is defined as

$$\mathcal{KL}(p||q) = -\int p(x) \ln \left\{ \frac{q(x)}{p(x)} \right\} dx$$

Evaluate the Kullback-Leibler divergence when  $p(\mathbf{x}) = \mathcal{N}(\mathbf{x}|\boldsymbol{\mu}, \boldsymbol{\Sigma})$  and  $q(\mathbf{x}) = \mathcal{N}(\mathbf{x}|\mathbf{m}, \mathbf{L})$ 

2. Entropy of a distribution p is given by

$$\mathcal{H}(x) = -\int p(x) \ln p(x) dx$$

Derive the entropy of the multivariate Gaussian  $\mathcal{N}(\mathbf{x}|\boldsymbol{\mu},\boldsymbol{\Sigma})$ 

## Solution:

1.

$$\mathcal{KL}(p||q) = -\int p(\mathbf{x}) \ln \left\{ \frac{q(\mathbf{x})}{p(\mathbf{x})} \right\} d\mathbf{x}$$

$$= \int \left[ \ln p(\mathbf{x}) - \ln q(\mathbf{x}) \right] p(\mathbf{x}) d\mathbf{x}$$

$$= \int \left[ -\frac{D}{2} \ln 2\pi - \frac{1}{2} \ln |\mathbf{\Sigma}| - \frac{1}{2} (\mathbf{x} - \boldsymbol{\mu})^{\mathsf{T}} \boldsymbol{\Sigma}^{-1} (\mathbf{x} - \boldsymbol{\mu}) \right]$$

$$+ \frac{D}{2} \ln 2\pi + \frac{1}{2} \ln |\mathbf{L}| + \frac{1}{2} (\mathbf{x} - \boldsymbol{\mu})^{\mathsf{T}} \boldsymbol{L}^{-1} (\mathbf{x} - \mathbf{m}) \right] p(\mathbf{x}) d\mathbf{x}$$

$$= \int \left[ \frac{1}{2} \ln \frac{|\mathbf{L}|}{|\mathbf{\Sigma}|} - \frac{1}{2} (\mathbf{x} - \boldsymbol{\mu})^{\mathsf{T}} \boldsymbol{\Sigma}^{-1} (\mathbf{x} - \boldsymbol{\mu}) + \frac{1}{2} (\mathbf{x} - \mathbf{m})^{\mathsf{T}} \boldsymbol{L}^{-1} (\mathbf{x} - \mathbf{m}) \right] p(\mathbf{x}) d\mathbf{x}$$

$$= \mathbb{E} \left[ \frac{1}{2} \ln \frac{|\mathbf{L}|}{|\mathbf{\Sigma}|} - \frac{1}{2} (\mathbf{x} - \boldsymbol{\mu})^{\mathsf{T}} \boldsymbol{\Sigma}^{-1} (\mathbf{x} - \boldsymbol{\mu}) + \frac{1}{2} (\mathbf{x} - \mathbf{m})^{\mathsf{T}} \boldsymbol{L}^{-1} (\mathbf{x} - \mathbf{m}) \right]$$

$$= \mathbb{E} \left[ \frac{1}{2} \ln \frac{|\mathbf{L}|}{|\mathbf{\Sigma}|} \right] - \mathbb{E} \left[ \frac{1}{2} (\mathbf{x} - \boldsymbol{\mu})^{\mathsf{T}} \boldsymbol{\Sigma}^{-1} (\mathbf{x} - \boldsymbol{\mu}) \right] + \mathbb{E} \left[ \frac{1}{2} (\mathbf{x} - \mathbf{m})^{\mathsf{T}} \boldsymbol{L}^{-1} (\mathbf{x} - \mathbf{m}) \right]$$

$$= \frac{1}{2} \ln \frac{|\mathbf{L}|}{|\mathbf{\Sigma}|} - \frac{1}{2} \mathbb{E} \left[ (\mathbf{x} - \boldsymbol{\mu})^{\mathsf{T}} \boldsymbol{\Sigma}^{-1} (\mathbf{x} - \boldsymbol{\mu}) \right] + \frac{1}{2} \mathbb{E} \left[ (\mathbf{x} - \mathbf{m})^{\mathsf{T}} \boldsymbol{L}^{-1} (\mathbf{x} - \mathbf{m}) \right]$$

$$= \frac{1}{2} \ln \frac{|\mathbf{L}|}{|\mathbf{\Sigma}|} - \frac{1}{2} \left[ (\boldsymbol{\mu} - \boldsymbol{\mu})^{\mathsf{T}} \boldsymbol{\Sigma}^{-1} (\boldsymbol{\mu} - \boldsymbol{\mu}) + \mathrm{Tr} (\boldsymbol{\Sigma}^{-1} \boldsymbol{\Sigma}) \right] + \frac{1}{2} \left[ (\boldsymbol{\mu} - \mathbf{m})^{\mathsf{T}} \boldsymbol{L}^{-1} (\boldsymbol{\mu} - \mathbf{m}) + \mathrm{Tr} (\boldsymbol{L}^{-1} \boldsymbol{\Sigma}) \right]$$

$$= \frac{1}{2} \ln \frac{|\mathbf{L}|}{|\mathbf{\Sigma}|} - \frac{1}{2} \left[ (\mathbf{L} - \boldsymbol{\mu})^{\mathsf{T}} \boldsymbol{\Sigma}^{-1} (\boldsymbol{\mu} - \mathbf{m}) + \frac{1}{2} \mathrm{Tr} (\mathbf{L}^{-1} \boldsymbol{\Sigma}) \right]$$

$$= \frac{1}{2} \ln \frac{|\mathbf{L}|}{|\mathbf{\Sigma}|} - \frac{1}{2} \mathrm{Tr} (\mathbf{I}) + \frac{1}{2} (\boldsymbol{\mu} - \mathbf{m})^{\mathsf{T}} \boldsymbol{L}^{-1} (\boldsymbol{\mu} - \mathbf{m}) + \frac{1}{2} \mathrm{Tr} (\mathbf{L}^{-1} \boldsymbol{\Sigma})$$

$$(8)$$

(9)

 $= \frac{1}{2} \left[ \ln \frac{|\mathbf{L}|}{|\mathbf{\Sigma}|} - D + (\boldsymbol{\mu} - \mathbf{m})^{\mathsf{T}} \mathbf{L}^{-1} (\boldsymbol{\mu} - \mathbf{m}) + \mathsf{Tr}(\mathbf{L}^{-1} \boldsymbol{\Sigma}) \right]$ 

Homework 2

2.

$$\mathcal{H}(\mathbf{x}) = -\int p(\mathbf{x}) \ln p(\mathbf{x}) d\mathbf{x}$$

$$= -\mathbb{E}[\ln p(\mathbf{x})] \qquad (10)$$

$$= -\mathbb{E}\left[-\frac{D}{2} \ln 2\pi - \frac{1}{2} \ln |\mathbf{\Sigma}| - \frac{1}{2} (\mathbf{x} - \boldsymbol{\mu})^{\mathsf{T}} \mathbf{\Sigma}^{-1} (\mathbf{x} - \boldsymbol{\mu})\right] \qquad (11)$$

$$= \frac{D}{2} \ln 2\pi + \frac{1}{2} \ln |\mathbf{\Sigma}| + \frac{1}{2} \mathbb{E}[(\mathbf{x} - \boldsymbol{\mu})^{\mathsf{T}} \mathbf{\Sigma}^{-1} (\mathbf{x} - \boldsymbol{\mu})] \qquad (12)$$

$$= \frac{D}{2} \ln 2\pi + \frac{1}{2} \ln |\mathbf{\Sigma}| + \frac{1}{2} \mathsf{Tr}(\mathbf{I}) \qquad (13)$$

$$= \frac{1}{2} [D \ln 2\pi + \ln |\mathbf{\Sigma}| + D] \qquad (14)$$

$$= \frac{1}{2} (D \ln 2\pi + \ln |\mathbf{\Sigma}| + D \ln e) \qquad (15)$$

$$= \frac{1}{2} [\ln(2\pi)^D + \ln |\mathbf{\Sigma}| + \ln e^D] \qquad (16)$$

## Problem 4.

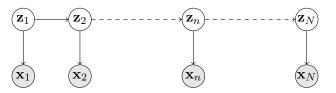

Figure 1: Markov chain of latent variables.

Given a graphical model in Figure 1. Show that:

1. 
$$p(\mathbf{x}_1, \dots, \mathbf{x}_{n-1} | \mathbf{x}_n, \mathbf{z}_n) = p(\mathbf{x}_1, \dots, \mathbf{x}_{n-1} | \mathbf{z}_n)$$

2. 
$$p(\mathbf{x}_1, \dots, \mathbf{x}_{n-1} | \mathbf{z}_{n-1}, \mathbf{z}_n) = p(\mathbf{x}_1, \dots, \mathbf{x}_{n-1} | \mathbf{z}_{n-1})$$

3. 
$$p(\mathbf{x}_{n+1},\ldots,\mathbf{x}_N|\mathbf{z}_n,\mathbf{z}_{n+1}) = p(\mathbf{x}_{n+1},\ldots,\mathbf{x}_N|\mathbf{z}_{n+1})$$

4. 
$$p(\mathbf{z}_{N+1}|\mathbf{z}_N, \mathbf{X}) = p(\mathbf{z}_{N+1}|\mathbf{z}_N)$$
, where  $\mathbf{X} = {\mathbf{x}_1, \dots, \mathbf{x}_N}$ 

 $= \frac{1}{2} \ln[(2\pi e)^D |\mathbf{\Sigma}|]$ 

#### Solution:

1. If we condition on  $\mathbf{z}_n$  then we have that for the d-separation principle holds

$$\mathbf{x}_1, \dots, \mathbf{x}_{n-1} \perp \mathbf{x}_n \mid \mathbf{z}_n \tag{18}$$

(17)

because every path connecting  $\mathbf{x}_1,\dots,\mathbf{x}_{n-1}$  with  $\mathbf{x}_n$  is blocked by  $\mathbf{z}_n$  (they are all head-to-tail edges) and therefore we can write

$$p(\mathbf{x}_1, \dots, \mathbf{x}_{n-1} | \mathbf{x}_n, \mathbf{z}_n) = p(\mathbf{x}_1, \dots, \mathbf{x}_{n-1} | \mathbf{z}_n)$$
(19)

Homework 2 4

2. If we condition on  $\mathbf{z}_{n-1}$ , we have that all paths connecting a node in  $\mathbf{x}_1, \dots, \mathbf{x}_{n-1}$  with  $\mathbf{z}_n$  are blocked by  $\mathbf{z}_{n-1}$  and for the d-separation principle we have

$$\mathbf{x}_1, \dots, \mathbf{x}_{n-1} \perp \mathbf{z}_n \mid \mathbf{z}_{n-1} \tag{20}$$

and therefore we can write

$$p(\mathbf{x}_1, \dots, \mathbf{x}_{n-1} | \mathbf{z}_{n-1}, \mathbf{z}_n) = p(\mathbf{x}_1, \dots, \mathbf{x}_{n-1} | \mathbf{z}_{n-1})$$
(21)

3. If we now condition on  $\mathbf{z}_{n+1}$ , all paths connecting a node in  $\mathbf{x}_{n+1}, \dots, \mathbf{x}_N$  with  $\mathbf{z}_n$  are blocked by  $\mathbf{z}_{n+1}$ . For the d-separation principle we have that

$$\mathbf{x}_{n+1}, \dots, \mathbf{x}_N \perp \mathbf{z}_n \mid \mathbf{z}_{n+1} \tag{22}$$

and therefore we can write

$$p(\mathbf{x}_{n+1}, \dots, \mathbf{x}_N | \mathbf{z}_n, \mathbf{z}_{n+1}) = p(\mathbf{x}_{n+1}, \dots, \mathbf{x}_N | \mathbf{z}_{n+1})$$
(23)

4. If we condition on  $\mathbf{z}_N$  then we have that all paths connecting  $\mathbf{z}_{N+1}$  with a node in  $\mathbf{X}$  are blocked by  $\mathbf{z}_N$ . For the d-separation we can then write

$$\mathbf{z}_{N+1} \perp \mathbf{X} \mid \mathbf{z}_N$$
 (24)

and therefore we can write

$$p(\mathbf{z}_{N+1}|\mathbf{z}_N, \mathbf{X}) = p(\mathbf{z}_{N+1}|\mathbf{z}_N)$$
(25)

**Problem 5.** An edge  $X \to Y$  in a graph  $\mathcal{G}$  is said to be covered if  $pa_Y = pa_X \cup \{X\}$ .

- 1. Let  $\mathcal{G}$  be a directed graph with a cover edge  $X \to Y$ , and  $\mathcal{G}'$  be the graph resulted by reversing the edge  $X \to Y$  to  $Y \to X$ , but leaving everything else unchanged. Prove that  $\mathcal{G}$  and  $\mathcal{G}'$  encode the same set of independent relations.
- 2. Provide a counterexample to this result in the case where  $X \to Y$  is not a covered edge.

### Solution:

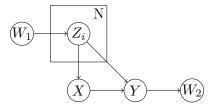

Figure 2: DAG with a cover edge  $X \to Y$ 

1. In Figure 2 is shown a generic DAG  $\mathcal G$  with a cover edge  $X \to Y$ . It is easy to see that it is the maximal generalization for which we can have a cover edge in  $X \to Y$  because adding nodes and connections to X and not to Y (directed towards) would result in losing the cover edge property. Also adding nodes similar to  $W_1$  or  $W_2$ , or changing the direction of their edges would not result in a different set of independent relations.
